

React Practice - 4

송민석 @ 2019-09-17

뭘 하나?

- 이번에는...
- Redirect
- 약 관리: 등록 / 삭제
 - Firebase CloudStore
- 약 관리 - redux store & redux saga

Redirect

```
function PrivateRoute({ component: Component, ...rest }) {  
  return (  
    <Route  
      {...rest} *  
      render={props =>  
        fakeAuth.isAuthenticated ? (  
          <Component {...props} />  
        ) : (  
          <Redirect  
            to={{  
              pathname: "/login",  
              state: { from: props.location }  
            }}  
          />  
        )  
      )  
    />  
  );  
}
```

revisit: Route

- 3가지 방법
 - component
 - render

```
<Route path="/user/:username" component={User} />;
```

```
// convenient inline rendering
```

```
<Route path="/home" render={() => <div>Home</div>} />
```

```
// wrapping/composing
```

```
// You can spread routeProps to make them available to your rendered Component
```

```
const FadingRoute = ({ component: Component, ...rest }) => (
```

```
  <Route {...rest} render={routeProps => (
```

```
    <FadeIn>
```

```
      <Component {...routeProps} />
```

```
    </FadeIn>
```

```
  )} />
```

```
)
```

```
<FadingRoute path="/cool" component={Something} />
```

```
<Route children={({ match, ...rest }) => (
```

```
  { /* Animate will always render, so you can use lifecycles  
    to animate its child in and out */
```

```
  <Animate>
```

```
    {match && <Something {...rest} />}
```

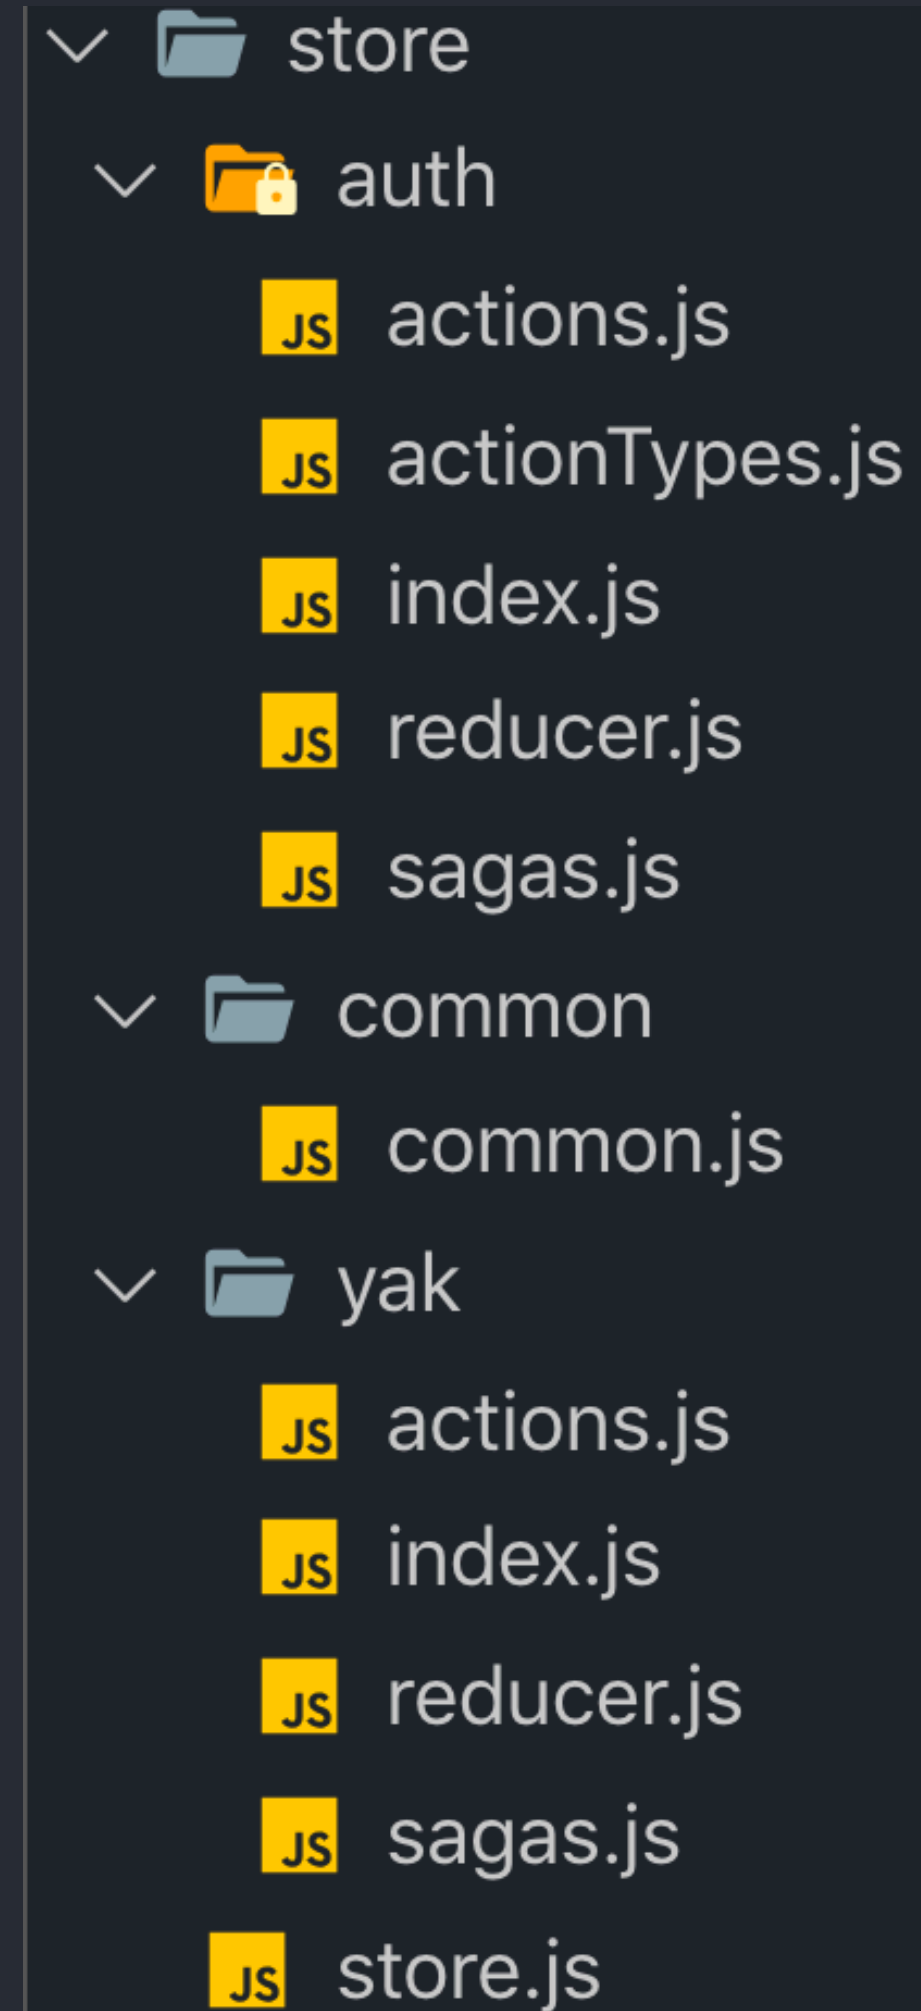

```
  </Animate>
```

```
)} />
```

- children

약 관리 - 등록/삭제

- 여러 개의 reducers
- 여러 개의 sagas
 - auth, yak
 - 별도의 폴더 관리
 - 반복 코드 제거 (DRY - Don't Repeat Yourself)
 - 데이터 로직, 액션 분리

앞으로는 뭘 더 하나?

- <https://github.com/songminseok/yakmoa.git>
- 다음에는
- 복약이력: 달력 (library) — skip *^^*
- Javascript
 - Basic
 - Advanced
